STATE OF ALASKA
Department of Natural Resources
DIVISION OF GEOLOGICAL & GEOPHYSICAL SURVEYS

According to Alaska Statute 41, the Alaska Division of Geological and Geophysical Surveys is charged with conducting "geological and geophysical surveys to determine the potential of Alaskan land for production of metals, minerals, fuels, and geothermal resources; the locations and supplies of ground water and construction materials; the potential geologic hazards to buildings, roads, bridges, and other installations and structures; and shall conduct such other surveys and investigations as will advance knowledge of the geology of Alaska."

In addition, the Division of Geological and Geophysical Surveys shall collect, record, evaluate, and distribute data on the quantity, quality, and location of underground, surface, and coastal water of the state; publish or have published data on the water of the state and require that the results and findings of surveys of water quality, quantity, and location be filed; require that water-well contractors file basic water and aquifer data, including but not limited to well location, estimated elevation, well-driller's logs, pumping tests, flow measurements, and water-quality determinations; accept and spend funds for the purposes of AS 41.08.017 and 41.08.035, and enter into agreements with individuals, public or private agencies, communities, private industry, and state and federal agencies; collect, record, evaluate, archive, and distribute data on seismic events and engineering geology of the state; and identify and inform public officials and industry about potential seismic hazards that might affect development in the state.

Administrative functions are performed under the direction of the State Geologist, who maintains his office in Fairbanks. The locations of DGGS offices are listed below:

- | | |
|---|--|
| • 794 University Avenue (Suite 200) Fairbanks, Alaska 99709 (907) 474-7147 | • 400 Willoughby Avenue (3rd floor) Juneau, Alaska 99801 (907) 465-2533 |

This publication was released by the Division of Geological & Geophysical Surveys to provide information of active vendors of aggregate-related products in Alaska. The purpose of this report, required by AS 41.08.017, is to encourage **development** of Alaska's sand, gravel, rock, and soil resources. Seven hundred copies were printed in Fairbanks, Alaska, at a cost of \$2.40 per copy.

DIRECTORY OF AGGREGATE, ROCK, AND SOIL PRODUCERS IN ALASKA

BY

Richard D. Reger and Rodney A. Combellick¹

INTRODUCTION

Since 1981, the Alaska Division of Geological and Geophysical Surveys has published for public use general information on the volumes and values of sand and gravel and other rock materials produced annually in Alaska (Bundtzen and others, 1982, 1984, 1986, 1987, 1988; Eakins and others, 1983, 1985). Each year, we also receive numerous requests for information on who supplies various aggregate, rock, and soil products in our state. The purpose of this directory is to help potential customers locate active vendors of these materials.

SURVEY RESULTS

For the purposes of this compilation, Alaska is divided into eight regions (fig. 1). A questionnaire was developed to collect basic information on the types of materials being produced in our state by industrial organizations identified during preliminary surveys of business licenses, mining licenses, and telephone directories, and by direct telephone contacts. No formal specifications for materials classes were sent with the questionnaires; products were merely listed. Questionnaires were not sent to major land holders or government entities, even though many sell or produce aggregate, rock, and soil materials. These sources will be verified by a subsequent survey. Of 331 possible vendors initially identified, 103 (31.1 percent) completed and returned questionnaires.

Data from each response were entered into a computerized file for storage, sorting, and retrieval. Based entirely on information received from these active producers, vendors for 29 categories of sand-and-gravel, rock, soil, and related products are identified in each region, as well as instances where no vendors are known (table 1). In cases where we know that certain vendors produce materials that they did not indicate, such as placer metals (byproducts), we have not listed these items.

The greatest selection of products and vendors exists in the eastern interior and southcentral regions. In contrast, no private vendors are headquartered

¹Alaska Division of Geological and Geophysical Surveys, 3700 Airport Way, Fairbanks, Alaska 99709499.

INFORMATION CIRCULAR 32

in the northern and southwestern regions, where most of the aggregate is produced by petroleum companies, by various Native organizations, or by private organizations that are actually headquartered elsewhere. Responses from 13 companies (12.6 percent) indicate that they serve regions outside their home region, but others undoubtedly do also. Only one vendor outside Alaska responded to our questionnaire.

Material categories for which few (one to three) active vendors have been identified include glass sand, furnace slag, marble, limestone-travertine, lime, gypsum, barite, potting clays, light-weight aggregate, and byproducts. Other vendors undoubtedly offer these products but did not respond to our survey.

The first section of this directory lists vendors providing each of the 29 categories of materials in each region; categories for which no vendor has been identified are also shown. The second section lists aggregate products provided by each vendor in each region. Section three provides a complete alphabetical listing of vendors, including current addresses, key contact personnel, and current telephone numbers. A glossary defines technical terms used in this circular.

Our experience in locating active producers of sand, gravel, rock, and soil indicates that, in this industry, names and addresses of small companies especially seem to change frequently, perhaps reflecting changes in organization or viability. Users of this directory are urged to verify the products currently being offered by each vendor listed and to ensure that these products meet their needs. To provide as accurate information as possible, we plan to update this directory every 2 years.

ACKNOWLEDGMENTS

This circular would not have been completed without patient, tedious work by Janette M. **Heral** and Bret E. Davidson, student interns in the DGGGS Engineering Geology Section. Milton A. Wiltse and Jeffrey T. Kline of DGGGS reviewed an early draft of this directory and provided several very helpful suggestions. We thank Ann-Lillian C. **Schell** of DGGGS for capably handling editing and final production details.

GLOSSARY OF TECHNICAL TERMS

Aggregate Natural particles, crushed and broken rock, and manmade materials that are graded by size into categories to meet specifications for particular construction uses (Evans, 1978, p. 4).

Armor rock Stone resulting from blasting, cutting, or other methods to obtain pieces heavy enough (generally 1 to 3 tons) to require handling two individual pieces by mechanical means (ASTM, 1988a, Designation D653-87). Used to protect beds, banks, shores, and embankments against intense erosion and scour by running water, tidal currents, and wave action.

Asphalt sand and gravel Sized and broken sand and gravel mixed with asphalt in batch plants to form asphalt concrete and road pavements (ASTM, 1988b, Designation D8-87). Dry, clean, fractured particle faces adhere well to bitumen and pack (interlock) efficiently to provide increased concrete and pavement strength (Evans, 1978, p. 4).

Barite Barium sulfate, which has a specific gravity of 4.3 to 4.6 (Ford, 1958, p. 748).

Blasting sand Abrasive sand, generally composed of angular to subangular, durable (unfractured) quartz grains, used for sandblasting (Evans, 1978, p. 5-6).

Built-up roof aggregate Clean, hard, durable crushed stone and gravel that are free of clay, loam, sand, and other foreign substances and are spread on asphalt roof surfaces (ASTM, 1988b, Designations D1863-86, D1864-81, and D1865-83). Must be opaque to the transmission of light to prevent alteration of underlying roofing materials (ASTM, 1988b, Designation D1866-79).

Byproducts Placer metals, garnet, ilmenite, chromite, rare-earth elements, zircon, cassiterite and other minerals concentrated during the mechanical processing of natural aggregates.

Cobble A rock fragment, usually rounded to subrounded, with an average dimension between 3 and 12 in. (75 and 305 mm)(ASTM, 1988a, Designation D653-87).

Concrete A composite construction material made by mixing properly-sized aggregate, a reactive binding medium (Portland cement), and

INFORMATION CIRCULAR 32

water into a slurry (ASTM, 1988b, Designation C125-88). Naturally rounded aggregate particles are desirable because they improve the workability of the mixture when it is poured (Evans, 1978, p. 4).

Concrete blocks Block-shaped structural elements made out of concrete.

Concrete sand and gravel A mixture of appropriately proportioned sand and gravel having a desirably small amount of deleterious substances (weathered feldspars, reactive **chert**, iron-stone concretions, silt and clay particles, organic matter, friable particles, and detrital coal) to make concrete for specific construction purposes (ASTM, 1988b, Designation C33).

Crushed rock Reasonably clean, tough, durable rock fragments broken by crushing coarse rock fragments or aggregate so that essentially all particle faces are freshly fractured (ASTM, 1988a, Designation D693-84; Langer, 1988, p. 3).

Dimension stone Natural stone that has been selected, trimmed, or cut to specified or indicated shapes or sizes, with or without one or more mechanically dressed surfaces (ASTM, 1988a, Designation C119-87a).

Drain rock Clean, subrounded rock fragments, principally cobble sized, used as fillings in surface and subsurface drainage structures. Informally called leach rock, bull rock, and sewer rock.

Filter sand Generally silica-rich, clean sand that is poorly graded (well sorted) and permeable (Evans, 1978, p. 5-6). Used extensively in water- and sewage-treatment plants and elsewhere for water conditioning and purification.

Furnace slag Nonmetallic, glassy material resulting from solidification of molten silicates and aluminosilicates of calcium and other base elements accumulated simultaneously with metallic iron under atmospheric conditions in a blast furnace (ASTM, 1988b, Designation C12588). Granulated for use in concrete and mortars (ASTM, 1988b, Designation C989-88).

Gabion rock Cobble-sized fillings of wire- or plastic-mesh **gabion** structures used to **retard** and deflect scouring stream flows as a means of bank protection.

Glass sand Generally silica-rich (quartz) sand used for the manufacture of glass. Must be free of iron oxides and chromium compounds and have a

GLOSSARY

minimum of other impurities, including alumina and oxides of calcium and magnesium, and must pass No. 20 U.S. Standard sieve (Evans, 1978, p. 5-6).

Gravel Rounded or subrounded rock particles that pass a 3-in. (76.2-mm) U.S. Standard sieve and are retained on a No. 4 (4.75mm) U.S. Standard sieve (ASTM, 1988a, Designation D653-87).

Gypsum Mineral or rock composed of hydrous calcium sulfate (Pettijohn, 1957, p. 479).

Horticultural peat Fibrous organic plant remains used to condition garden soils.

Light-weight aggregate Low-density, frequently cellular aggregate used to make lightweight concrete. Composed of expanded or sintered clay or shale (haydite) or slate, processed diatomite (diatomaceous earth) or diatomaceous shale, pumice, tuff, scoria, volcanic cinders, processed volcanic glass (perlite), vermiculite, expanded slag, and the products of coal or coke combustion (ASTM, 1988b, Designation C125-88).

Lime Calcium oxide.

Limestone Detrital or chemically precipitated sedimentary rock composed dominantly of calcium carbonate (Pettijohn, 1957, p. 381-382). Where recrystallized, microcrystalline limestone may be capable of acquiring a surface polish and may be sold as limestone or marble (ASTM, 1988a, Designation C119-87a).

Marble Metamorphosed carbonate rock with a distinctive crystalline texture and capable of acquiring a surface polish (ASTM, 1988a, Designation C119-87a).

Masonry-grout aggregate Aggregate composed of natural or manufactured sand or a mixture of sand and coarse particles that passes a 0.5-in. (12.5-mm) U.S. Standard sieve and is used to make grout for masonry purposes (ASTM, 1988b, Designation C404).

Masonry-mortar sand Natural and manufactured sand used in the preparation of mortar. Artificial mortar sand is produced by crushing stone, gravel, or air-cooled blast-furnace slag to ensure suitable particle shape and size gradation. Deleterious substances include friable and lightweight particles and organic impurities, including clastic coal (ASTM, 1988b, Designation C144-87).

Miscellaneous fill materials Manmade mixtures of soils and rock products that are not generally classified by texture, although they commonly contain abundant fine material. May contain considerable organic matter and artificial waste materials (ASTM, 1988a, Designation D653-87). Technically not an aggregate but a basic construction material (Evans, 1978, p. 4).

Ornamental stone Natural stone that, because of its distinctive structure, texture, color, and adequate durability, provides an appealing decorator material or art medium. Commonly includes jade, soapstone, serpentinites, agate, marbles, limestones (including travertines), dolomites, granitic rocks, quartzites, and sandstones.

Pavement products Road and airport subbases, bases, and travel surfaces composed of mixtures of asphalt and coarse, crushed aggregate (ASTM, 1988b, Designations D8-87 and D2940-74).

Peat Fibrous organic remains of plants with less than 2.5 percent by dry weight of noncombustible mineral ash that is preserved in marshy and swampy wetlands (ASTM, 1988a, Designation D2607-69).

Pit-run gravel Gravel or sandy gravel that is used without beneficiation after excavation from a natural deposit.

Potting clays Plastic soils composed of rock fragments smaller than 0.002 mm and platy clay minerals that are used for making pottery ware and figurines.

Ready-mix concrete Concrete that is freshly mixed at the vending site (batch plant) and then transported in a continually agitated, slurry state in mixer trucks to the job site for immediate placement (ASTM, 1988b, Designation C94; Dupras, 1989, p. 10).

Riprap rock Selected hard, angular, quarried stone generally weighing between 25 and 5,400 pounds individually and placed to protect beds, banks, shores, and embankments against wave action, tidal forces, and stream currents (ASTM, 1988a, Designation D653-87; ADOTPF, 1988, p. 305).

Rock Naturally occurring, consolidated materials composed of one or more minerals of the earth's crust (ASTM, 1988a, Designation, C119-87a). Any hard, consolidated materials derived from the earth and usually of relatively small size (Langer, 1988, p. 2).

GLOSSARY

Sand Particles of rock that pass a No. 4 (4.75-mm) U.S. Standard sieve and are retained on a No. 200 (75- μ m) U.S. Standard sieve (ASTM, 1988a, Designation D653-87).

Screened aggregate Aggregate that is separated into different classes of particle size by passing it through combinations of fixed or moving screens with standard-sized openings.

Soil Unconsolidated sediments made up of solid particles of various sizes and compositions and formed by the physical and chemical breakdown of rock (ASTM, 1988a, Designation D653-87; Jumikis, 1962, p. 27). May contain organic matter.

Stone Natural rock material of adequate integrity and quality that it can be quarried and then sawed, cut, split, or otherwise sized, shaped, or finished for specific purposes (ASTM, 1988a, Designation, C119-87a). Natural building stone includes granitic rocks, greenstones, limestones, marbles, massive serpentinite (antigorite), and sandstones,

Top soil Generally fine-grained surface soil, frequently including significant organic matter (ASTM, 1988a, Designation D653-87).

Travertine A variety of layered or banded, porous to dense, crystalline to microcrystalline limestone that is deposited by springs, seeps, or running water (ASTM, 1988a, Designation C119-87a; Pettijohn, 1957, p. 409).
